

Field Crops

Nearly ideal weather conditions during much of the 2004 crop year boosted production of many California field crops. Field crop production in California was valued at \$3.56 billion, up 6 percent from 2003, and the average value per harvested acre increased 20 percent from the previous year to \$837. California's major field crops produced 28.2 million tons in 2004.

California's highest-valued field crop in 2004 was hay, which totaled \$1.01 billion, followed by cotton at \$796 million. Of the total hay value, alfalfa accounted for \$853 million while other hay represented the remaining \$158 million. Nationally, the Golden State was the leading alfalfa-producing state, but ranked third for all hay production. The value of all hay increased 19 percent in 2004, whereas production decreased 5 percent. Ideal growing conditions and an early start to harvest had alfalfa hay yields on track to set a new record in California. Due to reduced surface water supplies in Central California during the second half of

the season and insect damage in some areas, final yields for 2004 fell slightly below the record high set in 1997.

The 2004 cotton crop resulted in record-high yields for both Upland and American Pima cotton in California. Production of the American Pima variety was up 84 percent from 2003, and Upland cotton production increased nearly 20 percent. All cotton production increased 33 percent from 2003, but the value increased only 7 percent due to a decrease in the per unit price of each variety. The unit price of Upland cotton dropped from 74.5 cents to 55.5 cents per pound, and the American Pima price decreased from \$1.23 to \$1.01 per pound. Planting of the 2004 cotton crop got off to an early start due to unseasonably warm weather conditions the first few weeks of March. Weather conditions remained favorable throughout the growing season, promoting rapid growth and development. Harvesting got underway in the San Joaquin Valley during the last week in September, but rain arrived in mid-October and delayed harvesting for many growers. More rain followed in November as did concerns of reduction in yield and quality. By the end of December, harvesting was essentially complete.

Rice harvested acreage and production increased 16 percent and 30 percent, respectively, in 2004. Value of production, however, showed a decline from the previous year of 13 percent. California rice producers increased their planted acreage in 2004, due to the lack of water right sales from the Northern California

The 2004 cotton crop resulted in record-high yields for both Upland and American Pima cotton in California.

rice growing regions to the Southern California Metropolitan Water District. Farmers planted rice on fields that had not produced the crop for many years. A warm, dry spring created ideal planting conditions, and good weather all season resulted in excellent stands with very little blanching. Increased acreage combined with record-high yields, however, put pressure on prices and resulted in a 33 percent decrease in the per unit price from 2003.

Dry bean harvested acreage in California declined 24 percent, and production dropped 16 percent in 2004, contributing to a 10 percent decline in total value. Favorable weather conditions promoted steady growth and development during the growing season. Harvesting of some varieties began in mid-September, but heavy rains in late October and early November delayed harvest or drove some growers to disc under some beans. Lack of rain on the Central Coast early in the year reduced some local yields.

California's 2004 corn for grain harvested acreage increased 7 percent, while production and value both increased 17 percent from the previous year. Early warm weather in April allowed growers to finish planting and promoted rapid growth in fields planted earlier. Robust growth continued throughout the growing season as warm weather prevailed. Harvesting began in some locations in August, and by November harvest was primarily complete.

Sugar beet acreage, production and values were down 2 percent in 2004. October rains slowed both planting and harvesting of the sugar beet crop. Sugar content and yields were very good in harvested fields.

Notable Increases in Value:

Cotton, American Pima	51%
Cottonseed	31%
Hay, Alfalfa.....	20%
Wheat, Other	18%

Significant Decreases in Value:

Cotton, Upland.....	11%
Oats	28%
Rice, All.....	13%
Wheat, Durum	24%

¹Area planted includes preceding fall.²Production is on a clean basis.³Dashes represent data not published due to the estimate being discontinued, not estimated, or not available.⁴Includes varieties not listed separately. Excludes beans grown for garden seed.⁵Planted acreage is for all purposes.⁶Cotton bales are 480 lbs. net-weight.⁷Estimated marketings of alfalfa and other hay used as weights to calculate all hay price for 1995-2004.⁸Sweet rice acreage included in 2003 and 2004 as short grain, but not in previous years.⁹Excludes wild rice. Sweet rice acreage included in 2003 and 2004, but excluded in prior years.¹⁰Initiated in 2000.¹¹Relates to year of intended harvest for fall planted beets in Central California and to year of planting for overwintered beets in central and southern California.

¹Includes one or more counties within a district that normally have less than 500 acres planted.

Poinsettia, orchids and florist mums led flowering plant sales growth.

Floriculture

Total value of floriculture sales in the United States was \$5.18 billion for 2004. California leads the country in sales with \$1.02 billion. The Golden State was the only one producing more than \$1 billion in sales; the next largest producer was Florida with \$825.7 million. Despite fierce competition from imported cut flowers, domestic growers of cut flowers reaped \$786,000 worth of sales on average in 2004. The next highest were bedding/garden plant producers, earning an average of \$591,300 according to the USDA's Economic Research Service. Sales per grower for the six floral crop groups were all record amounts in 2004, an indication that the average size of operations was larger.

Cut flower imports rose 16 percent in value in 2004, in part due to higher prices. The import share of U.S. consumption of cut flowers is now a record 64 percent, up from 61 percent from 2003. Imported cut flowers from Columbia grew in value by 21 percent in 2004. Imports from the second largest source, Ecuador, were

up 27 percent. Imports are largely responsible for the decline in domestic cut flower production.

Grower sales of cut fresh flowers were down with the drop attributed to fewer sales of roses and gladioli. Among the major cut flower states, sales in California, Florida and Hawaii were all lower in 2004.

Total U.S. supply of cut flowers was up 9 percent in value as imports more than made up for the decline in domestic production. Per household consumption of cut flowers reached \$10 for 2004. Of the total, \$6.40 was paid to foreign producers and \$3.60 went to domestic producers.

Poinsettia, orchids and florist mums led flowering plant sales growth. Producers in California, Florida, New York and Texas benefitted from this growth. For foliage plants, the largest producing state, Florida, suffered from the effects of hurricanes. While poinsettia sales fell in California, sales from North Carolina, Florida and New York all increased.

California cut flower sales totaled \$303.6 million, approximately 72 percent of the U.S. total. Golden State sales of potted flowering plants at \$192.2 million were more than twice that of runner-up Florida at \$92.6 million and approximately 24 percent of the U.S. total.
